

Owner: MicroShade A/S
No.: MD-23167-EN_rev1
Issued: 21-12-2023
Revision: 07-05-2024
Valid to: 21-12-2028

3rd PARTY VERIFIED

EPD

VERIFIED ENVIRONMENTAL PRODUCT DECLARATION | ISO 14025 & EN 15804

Owner of declaration

MicroShade
Ejby Industrivej 70, 2600
Glostrup, Denmark
VAT no. 27492207

Issued:

21-12-2024

Valid to:

21-12-2028

Programme

EPD Danmark
www.epddanmark.dk

- Industry EPD
- Product EPD

Basis of calculation

This EPD is developed in accordance with the European standard EN 15804+A2.

Comparability

EPDs of construction products may not be comparable if they do not comply with the requirements in EN 15804. EPD data may not be comparable if the datasets used are not developed in accordance with EN 15804 and if the background systems are not based on the same database.

Validity

This EPD has been verified in accordance with ISO 14025 and is valid for 5 years from the date of issue.

Use

The intended use of an EPD is to communicate scientifically based environmental information for construction products, for the purpose of assessing the environmental performance of buildings.

Declared product(s)

MicroShade®

Number of declared datasets/product variations: 1

Production site

The main production site is in Glostrup, Denmark. Subprocesses take place in Belgium (BE) and Germany (DE).

EPD type

- Cradle-to-gate with modules C1-C4 and D
- Cradle-to-gate with options, modules C1-C4 and D
- Cradle-to-grave and module D
- Cradle-to-gate
- Cradle-to-gate with options

Product(s) use

The EPD covers MicroShade® which provides integrated, passive solar shading which is to be installed into either a double or triple pane insulating glazing unit.

Declared/ functional unit

1 m² of MicroShade®.

Year of production site data (A3)

2023

Product information

Product description

The main product components are shown in the table below.

Material	Weight-% of declared product
Polyester film	41,6%
Polyolefine liner	29,3%
Epoxyacrylate copolymer	17,8%
Acrylate copolymer	10,8%
Inorganic constituents	0,4%

Product packaging:

The composition of the sales- and transport packaging of the product is shown in the table below.

Material	Weight-% of packaging
Pallet	53%
Cardboard box	32%
Core board (cardboard)	15%

Representativity

This declaration, including data collection and the modeled foreground system including results, represents the Cradle-to-gate impacts of producing 1 m² MicroShade® at the production sites in Denmark, Belgium, and Germany. The product specific data, covering the production process and packaging of the products, as well as supplier location and information on inbound transport, has been collected for the first six months of year 2023. Allocation of manufacturing data was based on the bill of materials or allocated based on square meters. Background data is based on Ecoinvent 3.9.1. All datasets are valid for year 2023 and the overall data representativeness is assessed to be fair.

Hazardous substances

MicroShade® does not contain substances listed on the "Candidate List of Substances of Very High Concern for authorisation" (<http://echa.europa.eu/candidate-list-table>)

Essential characteristics

Technical information can be obtained by contacting the manufacturer or on the manufacturers website: <https://microshade.com/microshade/>

Reference Service Life (RSL)

Not relevant for this study. MicroShade® is integrated into the insulating glazing unit and the reference service life therefore depends on the service life of the glazing.

Picture of product

LCA background

Declared unit

The LCI and LCIA results in this EPD relates to the declared unit (1m² MicroShade®).

Name	Value	Unit
Declared unit	1	m ²
Density	0,22	kg/m ²
Conversion factor to 1 kg.	4,55	m ² /kg

Functional unit

Not relevant for the assessment.

PCR

This EPD is developed according to the core rules for the product category of construction products in EN 15804+A2:2019.

Guarantee of Origin – certificates

No certified green electricity is used.

Foreground system:

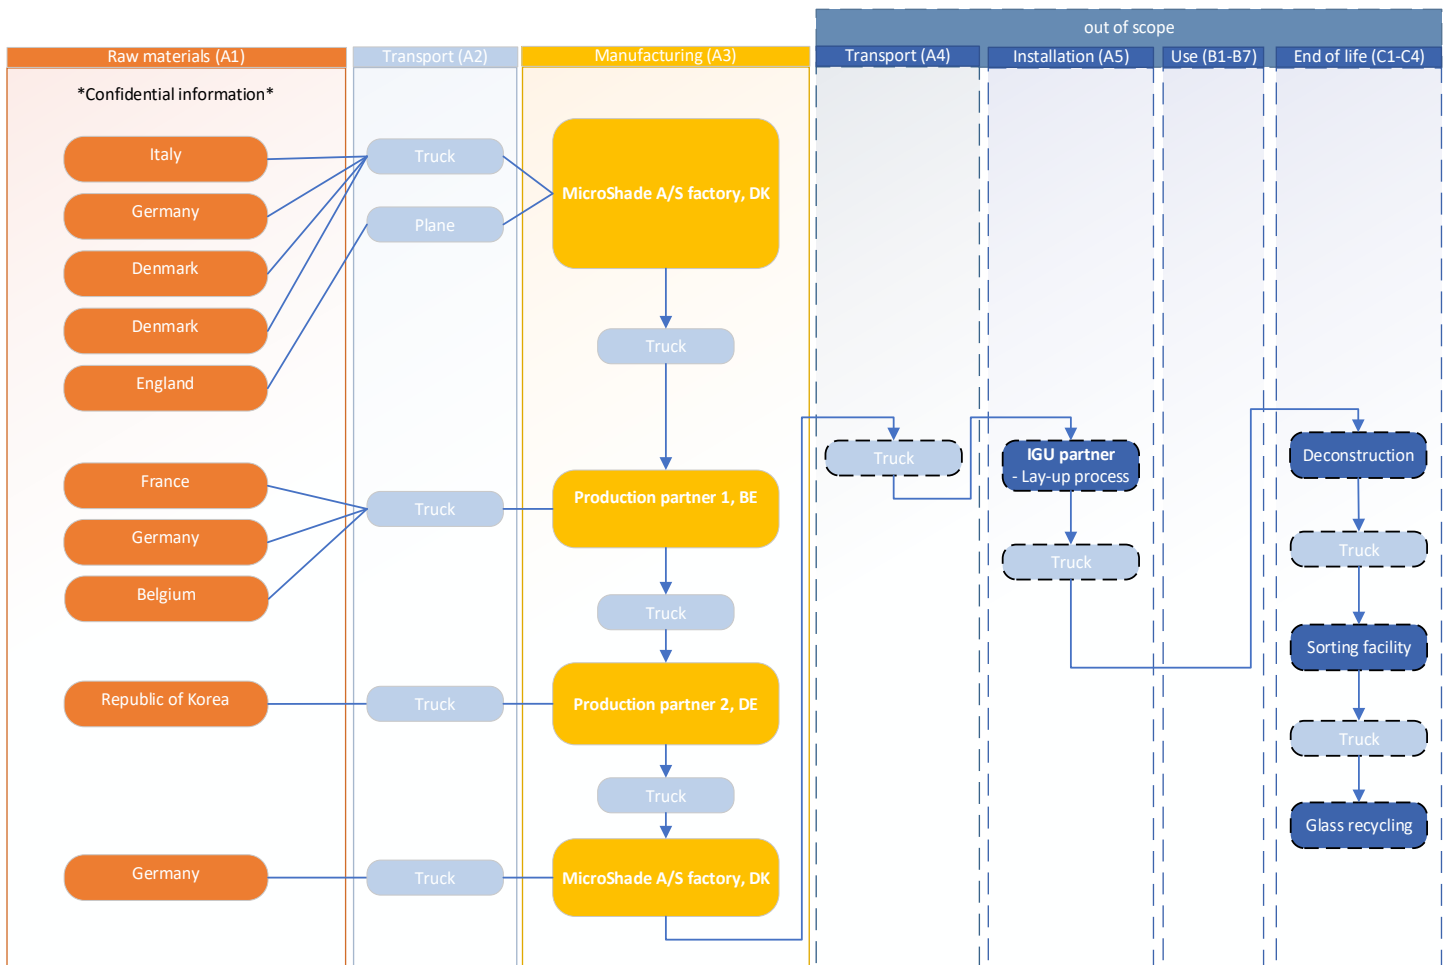

Processes at production sites in Belgium and Germany is modelled using residual mix.

Processes at the Danish site is modelled using specific residual mix (a mix of wind, biogas, and solar).

Background system:

Upstream processes (A1) are modelled using average global or European grid mix.

Flow diagram

System boundary

This EPD is based on a cradle-to-gate LCA, in which ~97% of mass input flows have been accounted for. Generally, packaging materials are included in the assessment. However, specific packaging materials for goods supplied to the production partners in Germany and Belgium are excluded due to a lack of data, representing approximately 3% of the total mass.

The general rules for the exclusion of inputs and outputs follows the requirements in EN 15804, 6.3.5, where the total of neglected input flows per module shall be a maximum of 5 % of energy usage and mass and 1 % of energy usage and mass for unit processes.

Product stage (A1-A3) includes:

A1 – Extraction and processing of raw materials
Include impacts from the extraction and production of raw materials and semifinished goods such as polymer films, coatings, and adhesives. The specific raw materials used are considered confidential and, therefore, are not listed in the flow diagram. Instead, the location of the supplier is indicated.

A2 – Transport to the production site
Include all transportation service from suppliers to the MicroShade production sites, including ship, aircraft, and lorry freight.

A3 – Manufacturing processes
The production of MicroShade® involves several steps. The Microstructure undergoes a 4-step process at the MicroShade A/S production factory in Glostrup. Once the microstructure is produced, a colour coating is applied, and finally, the

product is laminated together with a window film. The completed product is then transported to a glazing partner, where MicroShade® is integrated into the glazing unit.

This phase includes manufacturing process of the final product and the packaging materials (both raw materials, semi-finished goods, and the final product packaging). It includes the utilisation of electricity, water, gas, and auxiliary materials. Scrap and waste from production and the associated waste treatment is also accounted for up to the final disposal.

End of Life (C1-C4):

Following the EN 15804+A2 MicroShade® qualifies for exemption of modules C1-C4 and D due to the following reasons: (1) it is not a stand-alone product but rather an integrated component used in combination with glazing in a window assembly and is inseparable at the end of life, (2) it follows the glazing's end of life and is unidentifiable in a recycling process where glass is crushed and melted into new glass, and (3) MicroShade® does not contain biogenic carbon.

It is worth mentioning that 86% of waste outflows are accounted for since they occur in A3. Only the finished product and its final packaging are not declared, constituting 14% of waste outflows. The majority of waste is, therefore, included as part of this EPD, even though the C-modules are not declared.

LCA results

LCA results according to the preceding EN15804+A1 standard can be found in a separate appendix.

BIOGENIC CARBON CONTENT PER 1 m ² MicroShade®		
Parameter	Unit	At the factory gate
Biogenic carbon content in product	kg C	0E+00
Biogenic carbon content in accompanying packaging	kg C	5,50E-02
Note	1 kg biogenic carbon is equivalent to 44/12 kg a CO ₂	

Additional information

LCA interpretation

The figure below illustrates the contributions by life cycle phase. It is noticeable that the majority of impacts occur in A1, where the impacts are caused by the purchased raw materials to be used in the production of MicroShade®. The exception is in the GWP-total category, where the A3 phase is the most impactful due to the emissions from the electricity use. A2 has a relatively small impact compared to A1 and A3.

Focusing on GWP-total, it is observed that the A3 phase is the biggest contributor, followed closely by the A1 phase. The primary contributors across the phases are electricity use (40%), production of plastic granulate (16.7%), and waste incineration (11.5%). Other noteworthy contributors include the production of epoxy resins (10.2%) and potassium carbonate (3.8%).

In A2, the GWP-total impact naturally results from combusting fossil fuels. The most impactful transport process involves transporting the special polymers from a supplier in Italy to MicroShade's site in Denmark using a smaller truck/van. This process accounts for almost 4% of the GWP-total.

Indoor air

The EPD does not give information on release of dangerous substances to indoor air because the horizontal standards on the relevant measurements are not available. Read more in EN15804+A1 chapter 7.4.1.

Soil and water

The EPD does not give information on release of dangerous substances to soil and water because the horizontal standards on the relevant measurements are not available. Read more in EN15804+A1 chapter 7.4.2.
